medibyte

QA assessment brief

Find the defects. Report them clearly. Show us how you think.

MediByte — your trusted online pharmacy, delivered.

- For assessment use only — MediByte is a sample online pharmacy, not a real service. No real orders are placed and no real data is involved.

About the app

MediByte is an online pharmacy storefront. Customers can browse a catalog of over-the-counter (OTC) and prescription (Rx) products, search and filter the catalog, add items to a cart, apply promo codes, check out with a shipping address, and review their past orders and account details.

Over-the-counter OTC vs prescription Rx

Pharmacies sell two kinds of product, and the distinction matters as you test:

- **Over-the-counter (OTC)** — everyday medicines and health products anyone can buy without a doctor's authorization: pain relievers, vitamins, antacids, allergy tablets, first-aid supplies, and the like. In a store like this they behave like ordinary retail items — you pick them and buy them.
- **Prescription (Rx)** — medicines that legally require a valid prescription from a licensed prescriber before they can be dispensed (many antibiotics, cardiac and diabetes medicines, controlled substances, etc.). A pharmacy is expected to treat them differently from OTC items: it should establish that a prescription exists, and it handles the associated patient/health information as sensitive data.

Every product in the catalog is labelled as either OTC or Rx.

Your reviewer will send you a **personal access link** (it looks like `https://…/start?code=…`). **Open it before you sign in** — it unlocks the app for a limited window (typically 10 days) and is tied to the customer accounts listed under *Test data* below. After that the link expires. Use the same browser throughout so you keep your access and stay signed in.

Your task

Explore MediByte as a customer and **find and report as many defects as you can**. Treat it like a real product you've been asked to sign off on. Defects can fall into any of these areas — look across all of them:

- **Functional** — features that produce wrong results or behave incorrectly (calculations, totals, search, filtering, sorting, pagination, cart, checkout, stock/availability, validation).
- **Accessibility** — issues for keyboard and screen-reader users, color contrast, missing labels, focus handling. (Running an automated a11y checker such as axe or Lighthouse alongside manual testing is encouraged.)
- **Performance** — slow responses, missing loading feedback, redundant or oversized network requests, caching behavior.
- **Security** — anything that exposes data you shouldn't see, trusts the client where it shouldn't, or weakens how the app protects accounts and data.

- **UI** — visual and interaction problems (misleading controls, missing feedback, destructive actions without safeguards).
- **UX** — confusing or frustrating flows, surprise behavior, lost work, unclear errors or confirmations.

Write **test cases** for the areas you cover and a clear **bug report** for every defect you find. *What to submit*, at the end of this brief, sets out the format.

The DevTools Network tab is fair game

The app makes real API calls. You are expected and encouraged to open your browser's developer tools and inspect the **Network** tab (and the **Application** / storage tabs, and the **Console**) while you test. Request and response payloads, status codes, headers, timings, and what gets stored in the browser are all legitimate things to examine and report on.

Test data

Customer accounts

Sign in at `/login` with either of these customer accounts. Both come with some saved account data (addresses, insurance) and order history so the relevant flows have content to work with.

Email	Password
`dana@example.test`	`dana1234`
`omar@example.test`	`omar1234`

Promo codes

These promo codes can be applied in the cart while you test. They are provided as test data — use them to exercise the discount and checkout flows.

Code	What it offers	Minimum order	Notes
`SAVE10`	10% off your order	none	
`WELCOME5`	$5 off your order	$25	only applies at $25+
`WELLNESS15`	15% off your order	$40	only applies at $40+
`MEGA50`	$50 off your order	none	
`SPRING2023`	20% off (spring promo)	none	expired on 2023-05-31

What to submit

Fill in the Excel workbook that came with this brief, `QA-ASSESSMENT-TEMPLATE.xlsx`. It has a sheet for each part:

- **Test cases, traditional style** — ID, title, preconditions, test data, steps, expected result, actual result and status.
- **Test cases, BDD style** — the same kind of coverage written as Given / When / Then scenarios.
- **Bug reports** — one per defect: title, severity, steps to reproduce, expected and actual result, and a screenshot or recording where it helps.

Include both **positive** test cases (the feature works as intended) and **negative** ones (invalid input, edge cases, error paths), and mark which is which.

How to send it

Commit the workbook, with any screenshots or recordings, to a **Git repository** (GitHub, GitLab or Bitbucket). Reply to your reviewer's email with the repository URL before your link expires, and make sure they can open it.

The quality and clarity of your write-up is part of what we assess.
